***Abstract*—This thesis explores the application of white box testing and unit testing tools in C#. The author reviews the general concepts of software testing, white box testing, and unit testing, and applies these concepts to a student management application. The work highlights the importance of software testing and the need for effective testing methods and tools. The author describes the process of setting up and running unit tests with NUnit, and discusses the importance of covering all code paths in the application. The thesis concludes that software testing, especially unit testing, is crucial for ensuring software quality, but there is still a need for better implementation and coverage of all code paths.**

***Index Terms*—software testing, unit testing, white box testing, NUnit, C#, student management application**

I. Introduction

The thesis introduces the importance of software testing, particularly white box testing and unit testing, in the software development process. It aims to provide a comprehensive understanding of these testing methods and their practical application in C#. The author reviews existing literature on software testing, white box testing, and unit testing, and applies these concepts to a student management application. The work highlights the importance of software testing and the need for effective testing methods and tools. The author also discusses the limitations of the current implementation, such as the simplicity of the application and the lack of comprehensive coverage of the code paths [1].

II. Methods

The author reviews existing literature on software testing, white box testing, and unit testing. Practical application is demonstrated through the implementation of unit tests using NUnit in a student management application. The author describes the process of setting up and running unit tests with NUnit, and discusses the importance of covering all code paths in the application. The work highlights the importance of software testing and the need for effective testing methods and tools. The author also discusses the limitations of the current implementation, such as the simplicity of the application and the lack of comprehensive coverage of the code paths [1].

Supervisor: Bùi Anh Tú, Thai Nguyen University of Information and Communication Technology (batu@ictu.edu.vn).

III. Results

The author describes the process of setting up and running unit tests with NUnit, and discusses the importance of covering all code paths in the application. The work highlights the importance of software testing and the need for effective testing methods and tools. The author also discusses the limitations of the current implementation, such as the simplicity of the application and the lack of comprehensive coverage of the code paths. The author suggests improvements to the application code and the use of NUnit more effectively to ensure comprehensive testing coverage [1].

IV. Discussion

The author suggests improvements to the application code and the use of NUnit more effectively to ensure comprehensive testing coverage. The work highlights the importance of software testing and the need for effective testing methods and tools. The author also discusses the limitations of the current implementation, such as the simplicity of the application and the lack of comprehensive coverage of the code paths. The author concludes that software testing, especially unit testing, is crucial for ensuring software quality, but there is still a need for better implementation and coverage of all code paths [1]. Earlier ICTU undergraduate work addressed software test automation [21].

V. Conclusion

The thesis concludes that software testing, especially unit testing, is crucial for ensuring software quality. However, there is still a need for better implementation and coverage of all code paths. The author suggests improvements to the application code and the use of NUnit more effectively to ensure comprehensive testing coverage. The work highlights the importance of software testing and the need for effective testing methods and tools. The author also discusses the limitations of the current implementation, such as the simplicity of the application and the lack of comprehensive coverage of the code paths [1].
