***Abstract*—This thesis presents the design of a software tool to assist in diagnosing, troubleshooting, and repairing the electrical system of the Kia Morning car. The author describes the diagnostic process and the specific components of the car's audio system, including the radio and speakers. The software is intended to aid technicians in identifying and resolving issues in the car's electrical system. The design includes a detailed description of the car's audio system components and their functions, but specific numerical evaluations are not provided. The work focuses on the theoretical aspects of the diagnostic process and the system's architecture, without providing empirical evidence of its effectiveness in practical applications.**

***Index Terms*—software, diagnosis, repair, Kia Morning, audio system**

I. Introduction

The thesis introduces the diagnostic process for automotive systems, emphasizing the importance of accurate diagnosis and repair. It outlines the steps involved in diagnosing issues, from collecting customer feedback to confirming the root cause and performing repairs. The author highlights the complexity of modern automotive systems, particularly the electrical system, which requires precise and efficient diagnostic tools. The software tool is designed to support technicians in identifying and resolving issues in the Kia Morning car's electrical system, focusing on the audio system components and their functions [1].

II. Methods

The author describes the design of a software tool to support the diagnosis and repair of the Kia Morning car's electrical system. The software includes a detailed description of the car's audio system components and their functions, as well as the diagnostic process. The design process involves a thorough understanding of the car's electrical system, including the placement and function of various components such as the radio, speakers, and control modules. The software is intended to provide a user-friendly interface for technicians to access and interpret diagnostic information [1].

Supervisor: Nguyễn Vôn Dim, Thai Nguyen University of Information and Communication Technology (nvdim@ictu.edu.vn).

III. Results

The software tool is designed to assist in diagnosing and repairing the electrical system of the Kia Morning car. It includes a detailed description of the car's audio system components and their functions, but specific numerical evaluations are not provided. The design includes a user-friendly interface for accessing diagnostic information, but the effectiveness of the tool in practical applications is not documented. The software is intended to aid technicians in identifying and resolving issues in the car's electrical system, particularly focusing on the audio system components [1].

IV. Discussion

The software tool is intended to aid technicians in diagnosing and repairing the Kia Morning car's electrical system. The author provides a detailed description of the car's audio system components and the diagnostic process, but no performance claims are made. The design focuses on the theoretical aspects of the diagnostic process and the system's architecture, without providing empirical evidence of its effectiveness in practical applications. The lack of empirical data limits the ability to assess the tool's real-world performance and utility [1].

V. Conclusion

The thesis concludes with a description of the software tool designed to support the diagnosis and repair of the Kia Morning car's electrical system. The author emphasizes the importance of accurate diagnosis and repair in automotive maintenance. The design includes a detailed description of the car's audio system components and their functions, but specific numerical evaluations are not provided. The work focuses on the theoretical aspects of the diagnostic process and the system's architecture, without providing empirical evidence of its effectiveness in practical applications [1].
