***Abstract*—This thesis focuses on the construction of practical exercises using Raspberry Pi, covering the understanding of Raspberry Pi and peripheral modules, software design for electronic circuits, and the design of a system with Raspberry Pi. The author also built practical applications using peripheral modules and Raspberry Pi. The work demonstrates the construction of various modules for practical exercises, aiming to facilitate the learning of embedded systems and IoT applications. The author successfully constructed practical exercises, but noted that the approach had limitations in fully utilizing all functionalities of Raspberry Pi. The practical exercises provided a hands-on approach to learning embedded systems and IoT, enabling students to integrate different problems and develop additional applications. However, some functionalities of Raspberry Pi were not fully utilized in the modules, and the implementation was limited by the time constraints and the author's limited experience with Raspberry Pi.**

***Index Terms*—Raspberry Pi, practical exercises, embedded systems, IoT**

I. Introduction

The thesis introduces the construction of practical exercises on Raspberry Pi, covering the history and development of Raspberry Pi, its applications, and the software and hardware setup required for practical exercises. The author discusses the advantages and limitations of the approach used. The Raspberry Pi is a low-cost, single-board computer that has gained popularity in the field of embedded systems and IoT due to its versatility and ease of use. The author aimed to create practical exercises that would help students understand the principles of embedded systems and IoT through hands-on experience. The author also highlighted the importance of using appropriate software tools and hardware components to ensure the exercises are effective and engaging [1]. Published books on the methods and subject of this project provide context for this English summary [5], [6].

II. Methods

The methods involved understanding Raspberry Pi and peripheral modules, learning software design for electronic circuits, and building a system with Raspberry Pi. The author used Thony Python IDE and Proteus software for programming and simulation. The author first studied the history and development of Raspberry Pi, including its hardware specifications and software capabilities. Then, the author learned how to design and simulate electronic circuits using Proteus software. Finally, the author built a system with Raspberry Pi and connected various peripheral modules to create practical exercises. The author used Thony Python IDE for programming and simulation, which provided a user-friendly interface for beginners [1].

Supervisor: Hồ Mậu Việt, Thai Nguyen University of Information and Communication Technology (hmviet@ictu.edu.vn).

III. Results

The practical exercises were successfully constructed, allowing students to apply their knowledge of embedded systems and IoT. The author noted that the approach was effective in facilitating practical learning but had limitations in fully utilizing all functionalities of Raspberry Pi. The author successfully implemented several practical exercises, including controlling LEDs, using sensors, and integrating cameras. However, the author acknowledged that some functionalities of Raspberry Pi were not fully utilized in the modules. For example, the author did not explore advanced communication protocols or complex networking capabilities. The implementation was limited by the time constraints and the author's limited experience with Raspberry Pi [1].

IV. Discussion

The practical exercises provided a hands-on approach to learning embedded systems and IoT, enabling students to integrate different problems and develop additional applications. However, the author acknowledged that some functionalities of Raspberry Pi were not fully utilized in the modules. The author suggested that further development could fully leverage the capabilities of Raspberry Pi. The author also highlighted the need for more comprehensive training and resources to support students in their learning. The practical exercises were successful in meeting the objectives set by the topic, providing a practical learning environment for students. However, the author emphasized the need for continuous improvement to enhance the learning experience and fully utilize the potential of Raspberry Pi [1].

V. Conclusion

The thesis concluded that the practical exercises on Raspberry Pi were successful in meeting the objectives set by the topic, providing a practical learning environment for students. The author highlighted the need for further development to fully leverage the capabilities of Raspberry Pi. The author suggested that future work could focus on exploring advanced functionalities of Raspberry Pi and developing more comprehensive training materials. The author also emphasized

the importance of continuous improvement to enhance the learning experience and fully utilize the potential of Raspberry Pi [1].
