

Developing a sales management application with personalized menu suggestions based on artificial intelligence.

Pham Duc Nha

Abstract: The project aims to modernize the sales and customer healthcare process through technology. The author develops a cross-platform application that enables product and order management, and integrates an AI-based intelligent menu suggestion system. The system uses the non-relational database MongoDB for flexible data storage and a microservices architecture to optimize processing. Through JSON-processing APIs, the application can return a personalized list of dishes based on user ID, enhancing engagement and delivering practical nutritional value.

Keywords: Sales management, Menu suggestion, MongoDB
