

Building a foreign language center management system integrated with an intelligent advisory assistant.

Nguyen Tien Viet

Abstract: Design a comprehensive management system (mini ERP) for language centers, including modules for student management, class management, instructor management, and tuition fee management. A key feature is the integration of an AI chatbot trained on the center's own data to automatically answer inquiries about learning paths, class schedules, and tuition fees. The system helps optimize operational processes and enhance 24/7 customer service efficiency.

Keywords: Foreign language center management, AI Chatbot, Information system
