***Abstract*—This undergraduate thesis investigates a human resource management application for Hunonic in Thai Nguyen. An organization needs consistent employee records and a way to follow related personnel processes. The student analyzes personnel-management requirements and builds an application for staff information and related management tasks. The source describes the intended functions and example system pages. The conclusion presents the application as able to store and manage employee information and support personnel workflows. Statements about time savings, fewer errors, and transparency are author-reported benefits rather than independently measured outcomes. The thesis recognizes that integration with existing organizational systems can be difficult. It does not report a real-company deployment, a privacy audit, or a quantified productivity evaluation. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—human resources, employee records, Hunonic, management software**

I. Introduction

An organization needs consistent employee records and a way to follow related personnel processes. This thesis investigates a human resource management application for Hunonic in Thai Nguyen. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4], [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student analyzes personnel-management requirements and builds an application for staff information and related management tasks. The source describes the intended functions and example system pages. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Nguyễn Thị Dung, Thai Nguyen University of Information and Communication Technology (ntdung@ictu.edu.vn).

III. Results

The conclusion presents the application as able to store and manage employee information and support personnel workflows. Statements about time savings, fewer errors, and transparency are author-reported benefits rather than independently measured outcomes. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The thesis recognizes that integration with existing organizational systems can be difficult. It does not report a real-company deployment, a privacy audit, or a quantified productivity evaluation. Further work could test role-based access, data protection, integration with existing systems, and user tasks in the actual operating setting. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a human resource management application for Hunonic in Thai Nguyen. The conclusion presents the application as able to store and manage employee information and support personnel workflows. Statements about time savings, fewer errors, and transparency are author-reported benefits rather than independently measured outcomes. The thesis recognizes that integration with existing organizational systems can be difficult. It does not report a real-company deployment, a privacy audit, or a quantified productivity evaluation. Further work could test role-based access, data protection, integration with existing systems, and user tasks in the actual operating setting. Accordingly, the present contribution

is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
