***Abstract*—This thesis develops Afkar, a WordPress theme described on its cover as a creative personal portfolio. The implementation and conclusion also describe features of an online sales website, including product administration and customer interaction. The author built the template and its widgets with web technologies and reports that it satisfies basic sales-management functions. The source does not provide a measured usability, transaction, or deployment outcome. It proposes further design work, richer product information, and online payment integration. This summary retains the portfolio wording of the title while identifying the sales functions actually documented in the body.**

***Index Terms*—WordPress, Afkar, personal portfolio, theme, UML, HTML**

I. Introduction

The thesis provides an overview of WordPress and related tools, including plugins and web development languages. It aims to develop a creative personal portfolio theme named Afkar on the WordPress platform, emphasizing the use of HTML, CSS, and PHP. The introduction covers the basics of WordPress, such as the plugin Woocommerce, webserver requirements, and the cPanel interface. It also discusses HTML, CSS, and PHP, providing a foundation for the theme development [1]. Earlier ICTU student work on related designs is included here for context [6], [7]. Published technical books provide background for the methods discussed in this summary [8], [9]. Related published studies provide context for the subject and methods [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The author conducted a survey of the current state of the system, analyzed requirements, and designed the system using UML diagrams. The implementation involved developing a theme with basic functionalities for both administrators and users, including login, product management, and customer interaction features. The author used HTML, CSS, and PHP to create the theme, and UML diagrams were used to visualize the system architecture. The project was completed within the constraints of the student's knowledge and time, leading to a template that, while functional, is limited in scope [1].

Supervisor: Nguyễn Lan Oanh, Thai Nguyen University of Information and Communication Technology (nloanh@ictu.edu.vn).

III. Results

The resulting Afkar WordPress template contains section widgets and an interface for the sales-related functions documented in the thesis. The author's conclusion reports basic product and sales administration and a simple interface for users. The body also describes login and customer interactions. Although the title presents a personal portfolio theme, the documented implementation is substantially oriented toward an online shop. The source gives no quantified usability or commercial results, and payment integration is identified as future work [1].

IV. Discussion

The limitations of the template were acknowledged, and suggestions for improvement were made, including the need for additional design updates, integration with online payment systems, and more comprehensive product information. The project was completed within the constraints of the student's knowledge and time, leading to a template that, while functional, is limited in scope. The author recognized the need for more advanced skills and resources to fully develop the theme [1].

V. Conclusion

The author completed a WordPress template named Afkar. The source title describes a personal portfolio, whereas the implementation and conclusion emphasize basic online sales-management functions. The documented contribution is a functional student theme with custom widgets and a simple interface. Payment integration, additional product information, and further interface refinement remain proposed extensions. No measured user or business outcome is established by the manuscript [1].
