student532@ictu.edu.vn

***Abstract*—This thesis develops EcoHub, a WordPress theme centered on solar energy and ecology. The report describes HTML, CSS, PHP, WordPress, theme sections, and customizable widgets. Its demonstration includes administrative product, customer, and order operations and customer registration, search, purchase, and review flows. The author states that a basic online-sales site was deployed on a host, but also says the theme is incomplete. Bank-linked online payment and broader template designs are proposed for the future, not presented as finished functions. The source gives no measured sales effect or independent security evaluation. Its contribution is a documented WordPress theme and storefront prototype whose stated capabilities and limitations can be reviewed before broader reuse.**

***Index Terms*—WordPress theme, EcoHub, solar energy, e-commerce, PHP**

I. Introduction

A reusable WordPress theme can help an organization present products within a coherent visual design. This thesis applies that idea to a solar-energy and ecology concept named EcoHub. The author reviews WordPress operation and front-end technologies before developing a customizable template. The goal is to support a basic online-sales site and let users adapt sections. The source does not provide market research or measured commercial outcomes [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4], [5]. Published technical books provide background for the methods discussed in this summary [6]. Related published studies provide context for the subject and methods [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The author studies WordPress, HTML, CSS, and PHP, then develops the theme layout and widget-based sections. The report documents administrative screens for customer, product, and order management and customer pages for account use, search, buying, and comments. It also describes hosting the site for observation. The manuscript does not specify a security audit, formal cross-theme compatibility test, or controlled user study [1].

Supervisor: Nguyễn Lan Oanh, Thai Nguyen University of Information and Communication Technology (nloanh@ictu.edu.vn).

III. Results

The source shows a basic EcoHub template and online-sales interface with customer and administrator workflows. The conclusion reports that the site was placed on a host and that essential operations were implemented. It also says the template remains basic and incomplete. There is no verified count of users, sales, transactions, or performance improvement. The demonstrated outcome is the theme and associated student storefront, not a validated commercial platform [1].

IV. Discussion

Custom widgets and reusable sections make a theme easier to adapt, but maintenance, compatibility, accessibility, and payment handling require additional work. The author proposes more design variants and bank-linked online payments. Those items are future plans. The source does not establish that payment integration or business adoption occurred. A later evaluation should test security, responsiveness, product-data handling, and theme behavior under real hosting conditions [1].

V. Conclusion

The thesis documents EcoHub, a WordPress theme and basic storefront for a solar-energy and ecology concept. It presents customizable sections and customer and administrator functions. The author acknowledges an incomplete template and proposes new designs and payment links for later work. The project should be viewed as a student implementation; commercial effectiveness and operational safety have not been measured independently [1].
