***Abstract*—This undergraduate thesis investigates a configurable WordPress Patte theme for a pet service website. A small service website needs a reusable theme with editable sections and product presentation. The student installs WordPress, develops PHP-based theme components and widgets, and documents installation, activation, shortcodes, editable styles, product display, and basic purchase interactions. The manuscript illustrates a working theme and its configuration screens. The conclusion reports basic product display and buying features, with a hosted instance used to collect further data. The conclusion also calls the theme an online sales template, while the cover specifies pet services; this summary follows the cover title. The theme is described as basic and incomplete, and the source does not document real payments, customer uptake, or independently measured performance. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—WordPress theme, pet services, PHP, shortcodes**

I. Introduction

A small service website needs a reusable theme with editable sections and product presentation. This thesis investigates a configurable WordPress Patte theme for a pet service website. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3]. Related published studies provide context for the subject and methods [4], [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student installs WordPress, develops PHP-based theme components and widgets, and documents installation, activation, shortcodes, editable styles, product display, and basic purchase interactions. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Vũ Vinh Quang, Thai Nguyen University of Information and Communication Technology (vvquang@ictu.edu.vn).

III. Results

The manuscript illustrates a working theme and its configuration screens. The conclusion reports basic product display and buying features, with a hosted instance used to collect further data. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The conclusion also calls the theme an online sales template, while the cover specifies pet services; this summary follows the cover title. The theme is described as basic and incomplete, and the source does not document real payments, customer uptake, or independently measured performance. Further work could complete missing widgets, test the theme across devices and WordPress versions, and evaluate payment integration only in a controlled environment. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a configurable WordPress Patte theme for a pet service website. The manuscript illustrates a working theme and its configuration screens. The conclusion reports basic product display and buying features, with a hosted instance used to collect further data. The conclusion also calls the theme an online sales template, while the cover specifies pet services; this summary follows the cover title. The theme is described as basic and incomplete, and the source does not document real payments, customer uptake, or independently measured performance. Further work could complete missing widgets, test the theme across devices and WordPress versions, and evaluate payment integration only in a controlled environment. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness

should be assessed in later work using explicit evaluation conditions [1].
