***Abstract*—This undergraduate thesis investigates a Laravel-based document management website for ICTU. University users need a searchable place to access and share documents under appropriate controls. The student designs a website where users can browse, upload, and download documents and use accounts for favourites, ratings, and comments. The thesis also presents basic administrator review and editing functions. The conclusion reports the main document and account workflows in the student website. It acknowledges limited optimization, weak mobile support, and a feature set that remains incomplete. The source does not establish official ICTU deployment, an institutional document-retention policy, or a security and permissions audit for shared files. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—document management, Laravel, ICTU, web application**

I. Introduction

University users need a searchable place to access and share documents under appropriate controls. This thesis investigates a Laravel-based document management website for ICTU. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4]. Related published studies provide context for the subject and methods [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student designs a website where users can browse, upload, and download documents and use accounts for favourites, ratings, and comments. The thesis also presents basic administrator review and editing functions. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Lương Thị Minh Huế, Thai Nguyen University of Information and Communication Technology (lmhue@ictu.edu.vn).

III. Results

The conclusion reports the main document and account workflows in the student website. It acknowledges limited optimization, weak mobile support, and a feature set that remains incomplete. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The source does not establish official ICTU deployment, an institutional document-retention policy, or a security and permissions audit for shared files. Further work could test access rights and moderation, improve mobile display, and measure search and upload tasks with representative documents. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a Laravel-based document management website for ICTU. The conclusion reports the main document and account workflows in the student website. It acknowledges limited optimization, weak mobile support, and a feature set that remains incomplete. The source does not establish official ICTU deployment, an institutional document-retention policy, or a security and permissions audit for shared files. Further work could test access rights and moderation, improve mobile display, and measure search and upload tasks with representative documents. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
