***Abstract*—This undergraduate thesis investigates a mobile application supporting the General Informatics course. Students need convenient access to course knowledge and practice activities on mobile devices. The student builds a mobile learning prototype with course material, exercises, video viewing, and utility functions such as chat and a timer. The thesis documents its screens and interaction flow. The concluding section reports that basic learning content and exercises are available in a simple interface. It identifies incomplete functions, visual limitations, and data that still need optimization. The source does not measure learning gains, verify content coverage against an official syllabus, or report a controlled learner study. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—mobile learning, General Informatics, course exercises, educational application**

I. Introduction

Students need convenient access to course knowledge and practice activities on mobile devices. This thesis investigates a mobile application supporting the General Informatics course. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4], [5], [6]. Related published studies provide context for the subject and methods [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student builds a mobile learning prototype with course material, exercises, video viewing, and utility functions such as chat and a timer. The thesis documents its screens and interaction flow. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Vũ Thị Nguyệt, Thai Nguyen University of Information and Communication Technology (vtnguyet@ictu.edu.vn).

III. Results

The concluding section reports that basic learning content and exercises are available in a simple interface. It identifies incomplete functions, visual limitations, and data that still need optimization. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The source does not measure learning gains, verify content coverage against an official syllabus, or report a controlled learner study. Further work could add learning-progress tracking, refine the interface, and evaluate usability and learning tasks with students. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a mobile application supporting the General Informatics course. The concluding section reports that basic learning content and exercises are available in a simple interface. It identifies incomplete functions, visual limitations, and data that still need optimization. The source does not measure learning gains, verify content coverage against an official syllabus, or report a controlled learner study. Further work could add learning-progress tracking, refine the interface, and evaluate usability and learning tasks with students. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
