***Abstract*—This undergraduate thesis investigates an online sales website for the Cam Cam store in Tuyen Quang. A small store may need web pages for presenting goods and handling customer requests. The student reviews web-development concepts, analyzes the store website requirements, and implements a PHP-based site. The manuscript includes interface design and the pages that support the intended sales workflow. The conclusion states that the requested basic website functions were implemented and that the project improved the author's web-programming and system-analysis skills. It does not report verified sales, completed payment settlement, or routine use by the store. The author explicitly proposes further refinement to make the website more complete and professional. The manuscript does not include an independent usability, accessibility, or transaction-security assessment. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—e-commerce, PHP, store website, Cam Cam**

I. Introduction

A small store may need web pages for presenting goods and handling customer requests. This thesis investigates an online sales website for the Cam Cam store in Tuyen Quang. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4], [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student reviews web-development concepts, analyzes the store website requirements, and implements a PHP-based site. The manuscript includes interface design and the pages that support the intended sales workflow. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Phạm Thị Liên, Thai Nguyen University of Information and Communication Technology (ptlien@ictu.edu.vn).

III. Results

The conclusion states that the requested basic website functions were implemented and that the project improved the author's web-programming and system-analysis skills. It does not report verified sales, completed payment settlement, or routine use by the store. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The author explicitly proposes further refinement to make the website more complete and professional. The manuscript does not include an independent usability, accessibility, or transaction-security assessment. A store pilot could verify product accuracy, order handling, administrator tasks, and customer experience before any claim of commercial benefit. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents an online sales website for the Cam Cam store in Tuyen Quang. The conclusion states that the requested basic website functions were implemented and that the project improved the author's web-programming and system-analysis skills. It does not report verified sales, completed payment settlement, or routine use by the store. The author explicitly proposes further refinement to make the website more complete and professional. The manuscript does not include an independent usability, accessibility, or transaction-security assessment. A store pilot could verify product accuracy, order handling, administrator tasks, and customer experience before any claim of commercial benefit. Accordingly, the present contribution is a source-grounded account of the student work

and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
