***Abstract*—This undergraduate thesis investigates a life-insurance website prototype for Bao Viet in Cao Bang. An insurance information site needs account access, product presentation, and a clear enquiry or purchase flow. The student analyzes requirements and builds a demonstration website with registration, login, insurance-product administration, articles, discounts, cart, and checkout screens. The manuscript shows the principal customer and administrator interfaces and reports a functional demo of product and account management. The source says the system remains incomplete and proposes later deployment. It does not show issued policies, regulated insurance transactions, verified payments, or customer data protection. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—life insurance, Bao Viet, website prototype, product management**

I. Introduction

An insurance information site needs account access, product presentation, and a clear enquiry or purchase flow. This thesis investigates a life-insurance website prototype for Bao Viet in Cao Bang. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2]. Related published studies provide context for the subject and methods [3], [4], [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student analyzes requirements and builds a demonstration website with registration, login, insurance-product administration, articles, discounts, cart, and checkout screens. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Đoàn Thị Bích Ngọc, Thai Nguyen University of Information and Communication Technology (dtbngoc@ictu.edu.vn).

III. Results

The manuscript shows the principal customer and administrator interfaces and reports a functional demo of product and account management. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The source says the system remains incomplete and proposes later deployment. It does not show issued policies, regulated insurance transactions, verified payments, or customer data protection. Further work could validate the product information with the insurer, test user flows, and address privacy and transaction requirements before any real insurance use. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a life-insurance website prototype for Bao Viet in Cao Bang. The manuscript shows the principal customer and administrator interfaces and reports a functional demo of product and account management. The source says the system remains incomplete and proposes later deployment. It does not show issued policies, regulated insurance transactions, verified payments, or customer data protection. Further work could validate the product information with the insurer, test user flows, and address privacy and transaction requirements before any real insurance use. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
