***Abstract*—This undergraduate thesis investigates an English-language study and examination website. Learners benefit from a single site for practice material and test activities. The student uses PHP and WordPress to analyze requirements and build pages for English study, practice, and tests. The thesis documents the developed website and its principal learning and examination screens as a student prototype. The manuscript does not report a controlled learning-outcome study, question-bank validation, or operational reliability measurements. Its cover is dated December 2023 while later front matter is dated 2024. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—English learning, WordPress, online practice, web examination**

I. Introduction

Learners benefit from a single site for practice material and test activities. This thesis investigates an English-language study and examination website. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4], [5], [6]. Related published studies provide context for the subject and methods [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student uses PHP and WordPress to analyze requirements and build pages for English study, practice, and tests. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Dương Thị Quy, Thai Nguyen University of Information and Communication Technology (dtquy@ictu.edu.vn).

III. Results

The thesis documents the developed website and its principal learning and examination screens as a student prototype. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The manuscript does not report a controlled learning-outcome study, question-bank validation, or operational reliability measurements. Its cover is dated December 2023 while later front matter is dated 2024. Further work could review question quality, test scoring and access controls, and evaluate use with learners over a stated period. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents an English-language study and examination website. The thesis documents the developed website and its principal learning and examination screens as a student prototype. The manuscript does not report a controlled learning-outcome study, question-bank validation, or operational reliability measurements. Its cover is dated December 2023 while later front matter is dated 2024. Further work could review question quality, test scoring and access controls, and evaluate use with learners over a stated period. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
