***Abstract*—This undergraduate thesis investigates a restaurant management and ordering website for Manwah Thai Nguyen. Restaurant staff need to maintain food items and transactions while customers need a clear menu and ordering path. The student surveys restaurant tasks, models use cases and database entities, and develops a website with product and transaction management and user-facing pages. The source archive also includes implementation code. The conclusion reports that the principal restaurant workflows and administration screens operate in the student demonstration. It explicitly says password recovery and exceptional cases remain incomplete or insufficiently tested. The source does not establish live restaurant adoption, verified paid orders, or a security audit. The implemented main path should be distinguished from incomplete error handling and access control. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—restaurant management, Manwah, web application, ordering**

I. Introduction

Restaurant staff need to maintain food items and transactions while customers need a clear menu and ordering path. This thesis investigates a restaurant management and ordering website for Manwah Thai Nguyen. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4], [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student surveys restaurant tasks, models use cases and database entities, and develops a website with product and transaction management and user-facing pages. The source archive also includes implementation code. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Nguyễn Thị Dung, Thai Nguyen University of Information and Communication Technology (ntdung@ictu.edu.vn).

III. Results

The conclusion reports that the principal restaurant workflows and administration screens operate in the student demonstration. It explicitly says password recovery and exceptional cases remain incomplete or insufficiently tested. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The source does not establish live restaurant adoption, verified paid orders, or a security audit. The implemented main path should be distinguished from incomplete error handling and access control. Further work could complete password recovery, search, flexible permissions, and exceptional-case tests before operational deployment. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a restaurant management and ordering website for Manwah Thai Nguyen. The conclusion reports that the principal restaurant workflows and administration screens operate in the student demonstration. It explicitly says password recovery and exceptional cases remain incomplete or insufficiently tested. The source does not establish live restaurant adoption, verified paid orders, or a security audit. The implemented main path should be distinguished from incomplete error handling and access control. Further work could complete password recovery, search, flexible permissions, and exceptional-case tests before operational deployment. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims

about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
