

Building an online music streaming web application using Angular Framework

Truong Thanh Tung

Abstract: This topic focuses on building a web system that allows users to enjoy music online using the Angular Framework. In the context of the increasing demand for online entertainment, the topic aims to meet the requirements of managing and sharing audio content effectively. Through theoretical research and practical implementation, the system is built with the goal of providing a smooth and highly interactive user experience. The expected outcome of the topic is to provide a practical application solution that helps develop modern web programming skills.

Keywords: Online music streaming website, Angular Framework, Web development online, Audio content management, User experience
