***Abstract*—This undergraduate thesis investigates a job-search and application website for Thai Nguyen. Job seekers need to discover vacancies and submit applications, while employers need to present opportunities. The student analyzes requirements, designs a database and web interface, and implements pages for job discovery and application. The report documents site construction and user workflows. The conclusion reports a functional student job-search website for browsing and applying. It proposes better user experience, career information, a larger service scope, and employer partnerships as future development. The manuscript does not establish actual hiring outcomes, verified employer participation, or measured search efficiency. A working application page should not be read as a deployed labor-market service. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—job search, recruitment, web application, Thai Nguyen**

I. Introduction

Job seekers need to discover vacancies and submit applications, while employers need to present opportunities. This thesis investigates a job-search and application website for Thai Nguyen. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2], [3], [4]. Related published studies provide context for the subject and methods [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student analyzes requirements, designs a database and web interface, and implements pages for job discovery and application. The report documents site construction and user workflows. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Nguyễn Thu Phương, Thai Nguyen University of Information and Communication Technology (ntphuong@ictu.edu.vn).

III. Results

The conclusion reports a functional student job-search website for browsing and applying. It proposes better user experience, career information, a larger service scope, and employer partnerships as future development. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The manuscript does not establish actual hiring outcomes, verified employer participation, or measured search efficiency. A working application page should not be read as a deployed labor-market service. A later pilot could verify vacancy authenticity, applicant privacy, application delivery, and employer review with participating organizations. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a job-search and application website for Thai Nguyen. The conclusion reports a functional student job-search website for browsing and applying. It proposes better user experience, career information, a larger service scope, and employer partnerships as future development. The manuscript does not establish actual hiring outcomes, verified employer participation, or measured search efficiency. A working application page should not be read as a deployed labor-market service. A later pilot could verify vacancy authenticity, applicant privacy, application delivery, and employer review with participating organizations. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
