***Abstract*—This undergraduate thesis investigates a WordPress website for community health information. A clinic website needs clear presentation of services, staff, and appointment options. The student configures WordPress and develops the Meddox theme with editable pages, widgets, shortcodes, clinic departments, staff information, and an appointment interface. The thesis presents the theme screens and reports a basic clinic introduction and booking flow. It also describes recruitment and medical-product display sections. The cover frames the work as community health advice, while the conclusion emphasizes a clinic theme. The source does not establish clinical review of advice, real patient appointments, privacy safeguards, or a deployed care service. The contribution is a documented student study or prototype whose stated scope can guide further testing.**

***Index Terms*—WordPress, community health, clinic website, appointment booking**

I. Introduction

A clinic website needs clear presentation of services, staff, and appointment options. This thesis investigates a WordPress website for community health information. It begins from a practical engineering need and explains the technologies and workflow chosen for the case. The objective is to document a student implementation or comparative investigation, together with the evidence available in the manuscript. Broader operational or economic effects require separate measurements and are not assumed from the existence of a prototype [1]. Earlier ICTU student work on related designs is included here for context [2]. Related published studies provide context for the subject and methods [3], [4], [5], [6], [7], [8], [9], [10]. These contextual works were selected for this English summary; they are not asserted to appear in the original thesis bibliography.

II. Methods

The student configures WordPress and develops the Meddox theme with editable pages, widgets, shortcodes, clinic departments, staff information, and an appointment interface. The source is summarized through its stated design, implementation material, examples, and conclusion. Features shown in the manuscript are distinguished from proposals for later development. This review does not add a new experiment, fill missing measurements with estimates, or treat a planned capability as an observed result. The source thesis remains the provenance for the reported work [1].

Supervisor: Nguyễn Đình Dũng, Thai Nguyen University of Information and Communication Technology (nddung@ictu.edu.vn).

III. Results

The thesis presents the theme screens and reports a basic clinic introduction and booking flow. It also describes recruitment and medical-product display sections. The report's screens, configurations, examples, or measurements constitute the evidence for this summary. A capability described only as a design intention is not counted as a validated operational outcome. No additional performance, adoption, financial, or safety figure has been introduced here. The result is interpreted within the scope of the student's documented setup [1].

IV. Discussion

The cover frames the work as community health advice, while the conclusion emphasizes a clinic theme. The source does not establish clinical review of advice, real patient appointments, privacy safeguards, or a deployed care service. Further work could separate verified health information from marketing content, test the booking workflow, and review privacy and accessibility before use by patients. These limitations affect how the evidence should be read. The current manuscript can support understanding of the design and reported demonstration, while independent tests would be needed for stronger claims. Any later deployment should document its environment and separate observed outcomes from intended benefits [1].

V. Conclusion

The thesis documents a WordPress website for community health information. The thesis presents the theme screens and reports a basic clinic introduction and booking flow. It also describes recruitment and medical-product display sections. The cover frames the work as community health advice, while the conclusion emphasizes a clinic theme. The source does not establish clinical review of advice, real patient appointments, privacy safeguards, or a deployed care service. Further work could separate verified health information from marketing content, test the booking workflow, and review privacy and accessibility before use by patients. Accordingly, the present contribution is a source-grounded account of the student work and its tested or illustrated scope. Claims about broader effectiveness should be assessed in later work using explicit evaluation conditions [1].
