

Research on Reactjs, NodeJs, Express, Redux, MySQL applied to building a rental room website

Sam Quoc Anh

Abstract: In the context of the increasing demand for searching and managing information about rental rooms, this topic focuses on developing a web system based on Reactjs, NodeJs, Express, and MySQL technologies to provide an effective solution. The main objective of the research is to build a website that allows users to easily search, book, and manage rental room information. The implementation method includes requirement analysis, system design, and digital-oriented application deployment. The expected results of this topic not only improve the quality of life for consumers but also contribute to promoting technological development in the real estate sector.

Keywords: Room rental website, Reactjs, NodeJs, Express, MySQL
