

Build an online movie streaming website using ASP.NET

Pham Van Duc

Abstract: In the era of rapid digital development, the demand for enjoying and managing entertainment content such as movies is increasingly high. This topic aims to build a website system for online movie streaming based on the ASP.NET platform, with the goal of providing a convenient and diverse movie-watching experience for users. The research process includes requirement analysis, interface design, and application deployment. By applying modern technologies such as ASP.NET and SQL Server database, along with practical testing, the topic aims to contribute to the digital content industry and improve the quality of online entertainment services.

Keywords: Movie website, asp.net, content management, user interface, online entertainment
