

Building an AI Q&A; application with Windows Forms

Dao Hai Nam

Abstract: This topic focuses on building an AI-powered guidance application using a Windows Forms interface. In the context of the growing advancement of AI technology and the need to support users in solving problems independently through question-answering systems, this research aims to develop an application solution capable of understanding and responding to user questions naturally. The implementation method involves using natural language processing (NLP) techniques to develop the AI model and integrate it into the Windows Forms interface. The expected outcome is to provide users with an efficient and convenient interactive experience, while contributing to the development of AI-based support applications.
