

Development of an English vocabulary learning system on mobile platform.

Nguyen Manh Hieu

Abstract: This topic focuses on developing an effective and convenient English vocabulary education system on a mobile platform. The practical context requires foreign language learning methods that are more aligned with modern digital trends. The objective of the topic is to build and deploy a mobile application that provides diverse vocabulary exercises, aiming to enhance users' English communication skills through visual and engaging learning. The research methodology includes both theoretical aspects of foreign language education and user experiments to evaluate learning effectiveness. The expected outcome is a flexible vocabulary learning system that meets users' personalized learning needs and contributes to the development of digital education.

Keywords: Mobile language learning, vocabulary education system, mobile application development
