***Abstract*—This thesis explores the application of artificial intelligence (AI) in solving the 'Knight's Tour' problem through the installation and implementation of the 'Line' game. The author reviews the history and development of AI, various problem-solving methods, and heuristic techniques. The thesis includes the development of a game interface and a simulation program for the 'Knight's Tour' problem, but acknowledges limitations in depth and complexity. The author successfully developed a game interface for the 'Line' game and a simulation program for the 'Knight's Tour' problem, but the project was limited in depth and complexity, and the author plans to further explore AI techniques and develop more complex programs in the future.**

***Index Terms*—Artificial Intelligence, Knight's Tour, Line Game, Heuristic Search, Problem Solving**

I. Introduction

The thesis provides an overview of artificial intelligence (AI), its history, and various problem-solving methods. It aims to apply AI techniques to solve the 'Knight's Tour' problem by installing and implementing the 'Line' game. The author acknowledges the limitations of the project, such as the need for deeper exploration of AI trends and more complex program development. The thesis covers the historical development of AI, from its early origins to modern applications, and discusses various problem-solving methods, including exact, approximate, and heuristic techniques. The author also reviews heuristic search methods, such as greedy algorithms and hill-climbing, which are crucial for solving complex problems like the 'Knight's Tour' [1].

II. Methods

The thesis reviews AI theories and various problem-solving methods, including exact, approximate, and heuristic techniques. It then applies these methods to develop a game interface for the 'Line' game and a simulation program for the 'Knight's Tour' problem. The author discusses the implementation of the game interface, which includes the design of the user interface and the logic for the game mechanics. For the simulation program, the author implements heuristic search algorithms, such as depth-first search and greedy algorithms, to find solutions to the 'Knight's Tour' problem. The project was limited in depth and complexity, and the author acknowledges the need for further exploration of AI trends and techniques [1].

Supervisor: ICTU Teacher 97, Thai Nguyen University of Information and Communication Technology.

III. Results

The author successfully developed a game interface for the 'Line' game and a simulation program for the 'Knight's Tour' problem. However, the project was limited in depth and complexity, and the author acknowledges the need for further exploration of AI trends and techniques. The simulation program was able to find solutions to the 'Knight's Tour' problem using heuristic search algorithms, but the solutions were not always optimal. The author notes that the project did not include a comprehensive evaluation of the solutions found, and further research is needed to improve the effectiveness of the algorithms used [1].

IV. Discussion

The thesis discusses the historical development of AI, various problem-solving methods, and heuristic techniques. It highlights the application of these techniques in solving the 'Knight's Tour' problem through the 'Line' game. The author notes the limitations of the project and the need for further research in AI. The thesis covers the historical development of AI, from its early origins to modern applications, and discusses various problem-solving methods, including exact, approximate, and heuristic techniques. The author also reviews heuristic search methods, such as greedy algorithms and hill-climbing, which are crucial for solving complex problems like the 'Knight's Tour' [1].

V. Conclusion

The thesis concludes that the author successfully developed a game interface for the 'Line' game and a simulation program for the 'Knight's Tour' problem. However, the project was limited in depth and complexity, and the author plans to further explore AI techniques and develop more complex programs in the future. The author notes that the project did not include a comprehensive evaluation of the solutions found, and further research is needed to improve the effectiveness of the algorithms used. The author plans to continue studying AI and aims to develop more complex and effective programs in the future [1].
