***Abstract*—This thesis explores the theoretical foundations of digital certificates and their practical applications, focusing on the MD5 hash algorithm, digital signatures, and the Public Key Infrastructure (PKI). The author delves into the construction of a digital certificate system and its practical implementation, covering the creation and storage of certificates, and the development of a user interface for certificate management. The study also discusses the importance of PKI in managing digital certificates and ensuring the security of electronic communications. The implementation of the digital certificate system was successful, with detailed processes for creating and verifying digital signatures. The research highlights the role of PKI in securing data transmission and electronic transactions, suggesting areas for future research, such as enhancing the security of the digital certificate system and exploring new cryptographic methods.**

***Index Terms*—Digital Certificate, MD5, RSA, Public Key Infrastructure, Certificate Authority, Encryption**

## I. Introduction

The thesis begins with an overview of coding theory, specifically the MD5 hash algorithm, and discusses the importance of digital certificates in ensuring the security of information transmission over networks. It further explores the Public Key Infrastructure (PKI) and the role of Certificate Authorities (CAs) in issuing and managing digital certificates. The author provides a detailed explanation of the MD5 algorithm, its differences from MD4, and its security implications. The study also covers the concept of digital signatures, their legal status, and the process of creating and verifying them. The introduction sets the stage for the practical implementation of a digital certificate system, emphasizing the need for secure data transmission and electronic transactions [1]. Published articles on the methods and subject of this project provide context for this English summary [2]. Related earlier ICTU undergraduate theses provide context for this English summary [3]. Published books on the methods and subject of this project provide context for this English summary [4], [5].

## II. Methods

The methods section covers the theoretical analysis of the MD5 algorithm, digital signatures, and the RSA encryption method. The author discusses the design and implementation of a digital certificate system, including the creation and storage of certificates, and the development of a user interface for certificate management. The implementation involved creating a form for entering certificate information, storing the certificates in a database, and developing a user-friendly interface for managing these certificates. The study also includes detailed diagrams and flowcharts to illustrate the processes involved in the system's operation [1].

Supervisor: ICTU Teacher 98, Thai Nguyen University of Information and Communication Technology.

## III. Results

The results section describes the successful implementation of the digital certificate system, detailing the process of creating and verifying digital signatures. The system was designed to ensure the integrity and authenticity of transmitted messages. The author provides concrete examples of how the system works, including the creation of a digital certificate, the process of signing a document, and the verification of the signature. The implementation involved creating a form for entering certificate information, storing the certificates in a database, and developing a user-friendly interface for managing these certificates. The study highlights the effectiveness of the implemented digital certificate system in securing data transmission and electronic transactions [1].

## IV. Discussion

The discussion section evaluates the effectiveness of the implemented digital certificate system, emphasizing its role in securing data transmission and electronic transactions. The author highlights the importance of PKI in managing digital certificates and ensuring the security of electronic communications. The study suggests areas for future research, such as enhancing the security of the digital certificate system and exploring new cryptographic methods. The discussion also addresses the limitations of the current implementation, such as the potential vulnerabilities of the MD5 algorithm and the need for continuous updates to the system to address emerging security threats [1].

## V. Conclusion

The conclusion reiterates the importance of digital certificates in securing data and facilitating electronic transactions. The author suggests areas for future research, such as enhancing the security of the digital certificate system and exploring new cryptographic methods. The study emphasizes the need for ongoing research and development to ensure the continued security and effectiveness of digital certificate systems in the face of evolving security threats [1].
