***Abstract*—This thesis explores the integration of multimedia technology and e-learning in distance education, focusing on the implementation of Moodle as a platform. The author successfully created and packaged electronic lectures, integrated Moodle modules, and developed online learning websites. The project involved creating quizzes and offline exercises, setting up discussion forums, and mastering the Moodle system. However, the project faced limitations such as a limited number of courses and questions, and the need for more content tailored to Vietnamese learners. The author suggests using a larger host to improve online processing and developing more content to expand the system's scale.**

***Index Terms*—Multimedia, E-learning, Moodle, Online Learning, Distance Education**

I. Introduction

The thesis provides an in-depth examination of multimedia technology and e-learning in distance education. It begins with an explanation of multimedia and its role in education, followed by an overview of e-learning, including its definition, structure, and applications. The author then focuses on Moodle, detailing its features and functionalities, and describes the implementation of e-learning systems using this platform. The study aims to understand the potential of e-learning in distance education and to explore the practical aspects of implementing such systems [1]. Published books on the methods and subject of this project provide context for this English summary [2], [3], [5], [7], [8]. Related earlier ICTU undergraduate theses provide context for this English summary [4]. Published articles on the methods and subject of this project provide context for this English summary [6], [9]. Published articles on the methods and subject of this project provide context for this English summary [10].

II. Methods

The author uses Moodle to create and package electronic lectures, integrate various modules, and develop online learning websites. The project also involves creating quizzes and offline exercises for students, and setting up discussion forums. The author successfully understood and mastered the Moodle system, integrated several extended modules, and created electronic lectures packaged according to E-learning standards. The implementation process involved creating content for courses such as basic computer science and specialized courses, and incorporating multimedia elements like video lectures. The limitations of the project include a limited number of courses and questions, and the need for more content tailored to Vietnamese learners [1].

Supervisor: ICTU Teacher 99, Thai Nguyen University of Information and Communication Technology.

III. Results

The author successfully understood and mastered the Moodle system, integrated several extended modules, and created electronic lectures packaged according to E-learning standards. They developed online learning websites and discussion forums. The project involved creating quizzes and offline exercises for students, and setting up discussion forums. However, the project faced limitations such as a limited number of courses and questions, and the need for more content tailored to Vietnamese learners. The author suggests using a larger host to improve online processing and developing more content to expand the system's scale [1].

IV. Discussion

The author discusses the advantages and disadvantages of the project. The advantages include mastering the Moodle system, integrating extended modules, and creating electronic lectures. However, the project faces limitations such as a limited number of courses and questions, and the need for more content tailored to Vietnamese learners. The author suggests using a larger host to improve online processing and developing more content to expand the system's scale. The project demonstrates the potential of e-learning in distance education, but highlights the need for more comprehensive content and better infrastructure [1].

V. Conclusion

The author concludes that the project successfully demonstrated the ability to use and integrate Moodle, create electronic lectures, and develop online learning websites. However, the project faces limitations such as a limited number of courses and questions, and the need for more content tailored to Vietnamese learners. The author suggests using a larger host to improve online processing and developing more content to expand the system's scale. The study highlights the importance of tailored content and robust infrastructure in the successful implementation of e-learning systems [1].
