

Design and build a Social Network system with integrated Realtime Chat

Vu Trong Dai

Abstract: In the context of increasingly popular social networks, the issue of improving user experience through real-time chat features has become urgent. This topic aims to develop a Social Network system integrated with real-time chat based on the requirements of different user groups. The research method combines theory and experimentation, including analysis of current social network models, selection of appropriate technology for the real-time chat system, and deployment of a trial application. The expected result is a solution that enhances performance and user experience in social network interactions, contributing to the development of the real-time application field.
