***Abstract*—This thesis explores various software testing techniques and their application in website development. It covers the fundamental principles of software testing, including white-box and black-box testing methods, and discusses the importance of software quality assurance. The research also develops a software testing application for websites, focusing on link testing. The study highlights the need for robust testing practices in the software development process, emphasizing the significance of software testing in ensuring the reliability and functionality of software products. The research contributes to the understanding of software testing techniques and their application in website development, providing a foundation for further research and development in the field of software testing, particularly in the context of website applications.**

***Index Terms*—software testing, website testing, testing techniques, software quality, link testing**

I. Introduction

The thesis provides an overview of software engineering, emphasizing the challenges of software quality assurance in the rapidly evolving field of information technology. It discusses the importance of software testing in reducing the cost and time of software development, and the necessity of integrating testing processes into software development projects. The study highlights the need for comprehensive testing strategies to ensure the reliability and functionality of software products, particularly in the context of website applications. The research aims to address the limitations of current testing practices by exploring various testing techniques and their practical applications [1].

II. Methods

The research involves a comprehensive review of existing literature on software testing, including books and academic papers. The author also developed a software testing application for websites, focusing on link testing as a starting point. The application was tested for basic functionality, but further development is needed to include additional testing features such as syntax testing, JavaScript testing, and form data testing. The study emphasizes the importance of integrating testing processes into the software development lifecycle to ensure the quality and reliability of software products [1].

Supervisor: ICTU Teacher 110, Thai Nguyen University of Information and Communication Technology.

III. Results

The developed software testing application for websites was tested for basic functionality, but further development is needed to include additional testing features such as syntax testing, JavaScript testing, and form data testing. The research highlights the need for more comprehensive testing strategies in software development. The application was able to identify and report broken links, which is a crucial aspect of website functionality. However, the study did not conduct a formal evaluation of the application's effectiveness in improving the overall quality of the website [1].

IV. Discussion

The study concludes that software testing is crucial for ensuring the reliability and functionality of software products. However, due to time and resource constraints, the application developed only covers basic testing. Future work will expand the application to include more advanced testing features. The research contributes to the understanding of software testing techniques and their application in website development, providing a foundation for further research and development in the field of software testing, particularly in the context of website applications. The limitations of the study include the lack of formal evaluation and the need for more comprehensive testing strategies [1].

V. Conclusion

The research contributes to the understanding of software testing techniques and their application in website development. It provides a foundation for further research and development in the field of software testing, particularly in the context of website applications. The study highlights the need for robust testing practices in the software development process, emphasizing the significance of software testing in ensuring the reliability and functionality of software products. The research also underscores the importance of integrating testing processes into the software development lifecycle to ensure the quality and reliability of software products [1].
