

Developing a web application to support wood processing workshop management for family businesses.

Nong Thi Thu Ha

Abstract: In the context of the growing wood processing industry but with many management difficulties, this project aims to build a web application system to improve the operational efficiency of small household businesses. Using theoretical and experimental research methods, the project delves into designing a user-friendly interface, integrating functions for managing materials, products, and processing procedures. The expected results will provide a practical application solution, contributing to enhancing business productivity for family-run businesses.
