***Abstract*—This thesis focuses on the development of a dictionary application using the C# programming language. The author gained a deeper understanding of the C# language and applied binary search algorithms for efficient word lookup. The application supports various functionalities such as pronunciation, advanced search, and dictionary management. However, the application lacks specialized dictionaries for specific fields and advanced search features like synonyms and antonyms. The author plans to continue developing the application by adding specialized dictionaries and expanding its functionality to mobile devices.**

***Index Terms*—C#, dictionary application, binary search, Text-to-Speech, UML, Windows Forms**

I. Introduction

The thesis provides a comprehensive overview of the C# programming language and the .NET Framework, including key concepts such as data types, operators, and file handling. It also covers the Unified Modeling Language (UML) for software design, focusing on use cases and class diagrams. The author then delves into the development of a dictionary application, detailing the application's architecture and user interface. The application is built using C# and Windows Forms, with a focus on efficient data management and user interaction. The author also discusses the implementation of search algorithms such as binary search and fuzzy search, which are crucial for the application's functionality [1]. Published books on the methods and subject of this project provide context for this English summary [7].

II. Methods

The methods section covers the theoretical foundations of C# and .NET, including the .NET framework, MSIL, and C# language features. The author also discusses UML for software design and the implementation of search algorithms such as binary search and fuzzy search. The application was developed using C# and Windows Forms, with a focus on efficient data management and user interaction. The author utilized UML diagrams to model the application's architecture, including use cases and class diagrams, to ensure a clear and structured design. The implementation of the binary search algorithm was critical for efficient word lookup, while fuzzy search was used to provide approximate matches for words [1].

Supervisor: ICTU Teacher 149, Thai Nguyen University of Information and Communication Technology.

III. Results

The application successfully implemented a binary search algorithm for efficient word lookup, supported pronunciation through Text-to-Speech technology, and allowed users to add, edit, and delete dictionary entries. The application also included a feature to search for words using wildcards, which provided a flexible search mechanism. However, the application lacked advanced features such as synonym and antonym searches, and specialized dictionaries for specific fields. The author tested the application by manually entering words and phrases, and the binary search algorithm performed well, providing quick and accurate results [1].

IV. Discussion

The author discusses the limitations of the application, such as the absence of specialized dictionaries and advanced search features. The author plans to continue developing the application by adding specialized dictionaries and expanding its functionality to mobile devices. The author also mentions the need for further optimization of the application's performance and user interface. The author suggests that the application could benefit from additional features such as a dictionary for specialized fields, advanced search capabilities, and integration with mobile devices. The author also notes that the application could be improved by incorporating more advanced search algorithms and user-friendly features [1].

V. Conclusion

The thesis concludes that the developed application provides a comprehensive dictionary tool with basic functionalities, but there is room for improvement in terms of advanced search features and specialized dictionaries. The author plans to continue developing the application by adding specialized dictionaries and expanding its functionality to mobile devices. The author also emphasizes the importance of user feedback and further testing to ensure the application's effectiveness and usability [1].
