***Abstract*—This thesis explores the development of an online learning website using the open-source Moodle system. The study provides an overview of e-learning and discusses the benefits of using open-source software for online education, particularly in the context of Vietnam's integration into the World Trade Organization (WTO) and the need for software copyright protection. The author details the implementation of various features, including theme creation and localization, emphasizing the potential of Moodle to reduce costs and improve the quality of education. The research highlights the importance of local adaptation and customization of open-source software to meet specific educational needs.**

***Index Terms*—e-learning, Moodle, open source, Web development, online education, localization**

I. Introduction

The thesis introduces the concept of e-learning and its significance in modern education. It highlights the advantages of e-learning, such as flexibility and accessibility, and discusses the challenges faced by educational institutions, especially in terms of infrastructure. The study focuses on the use of Moodle as an open-source platform to support online learning, emphasizing its potential to reduce costs and improve the quality of education. The author also discusses the importance of software copyright protection and the need for local adaptation of open-source software to meet specific educational requirements [1]. Related earlier ICTU undergraduate theses provide context for this English summary [5], [6], [7]. Published articles on the methods and subject of this project provide context for this English summary [8], [9], [10].

II. Methods

The methods section covers the overall structure of Moodle, including its core components and the process of developing and customizing the system. The author discusses the localization of Moodle to suit the Vietnamese context, as well as the creation of themes to enhance the user experience. The implementation involved downloading the Moodle package, integrating the Vietnamese language, and developing various functionalities to support online learning. The study also explores the use of PHP and MySQL for web development, highlighting the flexibility and adaptability of the Moodle system [1].

Supervisor: ICTU Teacher 154, Thai Nguyen University of Information and Communication Technology.

III. Results

The results section details the implementation of the online learning website, including the design and deployment of various functionalities. The author describes the benefits of using Moodle, such as improved student engagement and the ability to provide personalized learning experiences. The study also highlights the successful localization of Moodle to the Vietnamese context, ensuring that the website is accessible and user-friendly for Vietnamese users. However, the evaluation of the system's effectiveness was not quantitatively measured, and the study primarily focuses on the implementation process [1].

IV. Discussion

The discussion section explores the implications of using Moodle for online education, particularly in the context of Vietnam's integration into the WTO. The author discusses the importance of software copyright protection and the need for local adaptation of open-source software to meet specific educational needs. The study emphasizes the potential of Moodle to reduce costs and improve the quality of education, but also notes the challenges in ensuring the system's effectiveness and sustainability. The author suggests that future work should focus on evaluating the system's impact on student learning outcomes and exploring ways to enhance the user experience [1].

V. Conclusion

The conclusion summarizes the key features developed and evaluates the effectiveness of the online learning website. The author suggests potential future directions for the project, emphasizing the importance of continuous improvement and adaptation to meet evolving educational requirements. The study highlights the benefits of using Moodle for online education, but also acknowledges the need for further research to fully assess its impact on student learning and educational outcomes [1].
