

Building a smart recruitment management web system that supports analyzing and evaluating candidate profiles using artificial intelligence.

Le Duc Anh

Abstract: In the increasingly complex context of recruitment, building an intelligent recruitment management web system aimed at automating the processing and classification of candidate resumes is necessary. This topic is based on theoretical research on artificial intelligence (AI) combined with experimentation to develop algorithms for analyzing candidate resumes. The results of the topic not only improve recruitment performance but also contribute to the development of AI technology in the human resources field.
