

Research and development of the mobile task management application "YTask" integrated with an AI assistant

Than Duc Anh

Abstract: In the context of today's strong digitalization, the necessity of an effective task management solution is undeniable. This topic focuses on researching and developing the YTask mobile application, a system integrated with artificial intelligence to assist users in managing daily tasks. The approach combines theoretical research and experimentation to build a user-friendly interface while optimizing the user experience through the application of task prediction algorithms. The expected outcome is a practical application solution with great potential for improving individual and team work performance.

Keywords: Mobile application, task management, AI assistant, artificial intelligence, research and development
