***Abstract*—This undergraduate project examines "Materials Accounting Program for Nguyen Phat Trading and Minerals Joint Stock Company in Cau Giay, Hanoi." The student studied material and tool accounting at Nguyen Phat Trading and Minerals and built a program for the selected accounting task. The source conclusion stresses the importance of material records and describes the program as a contribution to improving that workflow. Accounting software must preserve vouchers and balances that can be checked against the source transactions. The work should therefore be cited as a student application and accounting-process analysis, rather than proof that the company's performance improved. Further validation with real transaction series would be necessary for that conclusion. The work is reported within the scope supported by the original manuscript, without assuming an unrecorded deployment or quantitative benefit.**

***Index Terms*—material accounting, inventory management, cost control, financial reporting, company management, accounting program**

I. Introduction

Accounting software must preserve vouchers and balances that can be checked against the source transactions. The thesis examines an organization's existing workflow and the information needed to support its selected task. It identifies a practical task, selects functions to study or build, and explains why the task matters to the organization concerned. The evidence for the project is its requirements analysis, design material, and described implementation. Intended advantages are distinguished from effects actually established in the manuscript [1].

II. Methods

The student analyzed the selected case, described the relevant records and procedures, and prepared the design or program functions reported in the thesis. The design links input records to the updates, searches, reports, or other functions relevant to the task. Functional descriptions, diagrams, interfaces, and source conclusions are used where present to identify completed work. The manuscript is not treated as evidence of an additional user trial or dataset that it does not document [1].

Supervisor: Vũ Xuân Nam, Thai Nguyen University of Information and Communication Technology (vxnam@ictu.edu.vn).

III. Results

The student studied material and tool accounting at Nguyen Phat Trading and Minerals and built a program for the selected accounting task. The source conclusion stresses the importance of material records and describes the program as a contribution to improving that workflow. It does not report a formal test or measured increase in reporting accuracy, reduction in costs, or company-wide adoption. The supported result is the case analysis and implemented program, with operational effects remaining to be checked against complete material transactions [1].

IV. Discussion

The student studied material and tool accounting at Nguyen Phat Trading and Minerals and built a program for the selected accounting task. The source conclusion stresses the importance of material records and describes the program as a contribution to improving that workflow. The reported functions can be interpreted against the original organizational need, but implementation alone does not establish every intended benefit. The work should therefore be cited as a student application and accounting-process analysis, rather than proof that the company's performance improved. Further validation with real transaction series would be necessary for that conclusion. A later evaluation should reconcile the program's outputs with verified accounting records. The source provides a case study and a basis for later verification of completeness, reliability, and use [1]. Earlier ICTU undergraduate work by Nguyễn Thị Hoài addressed materials accounting software [10].

V. Conclusion

The thesis presents a materials-accounting program grounded in an internship at Nguyen Phat. Its author explains why timely and accurate records matter to management and reports building the program as a practical contribution. The manuscript does not provide an independent evaluation of accuracy or savings. The work should therefore be cited as a student application and accounting-process analysis, rather than proof that the company's performance improved. Further validation with real transaction series would be necessary for that conclusion [1].
