***Abstract*—This undergraduate thesis addresses sales management at Tan Viet Dung Construction and Trading Services. The student surveyed the business process and used Visual C# and a SQL database for system design. The report reports program-interface and database work for the selected sales tasks. Sales management joins customer, product, contract, invoice, and payment information. The documented contribution is the case analysis and the selected software or analytical work described in the manuscript. The report does not document a controlled user trial or independently measured efficiency improvement. Its practical value can be assessed further through the specific records and users involved in this task.**

***Index Terms*—Sales Management, Visual C#, Database Design, Software Development, Information Systems**

I. Introduction

Sales management joins customer, product, contract, invoice, and payment information. The organization in this thesis faced a concrete need concerning sales management at Tan Viet Dung Construction and Trading Services. The student used that setting to define a manageable graduation project and to select the records and functions most relevant to the case. The work aims to organize the process and make its main steps easier to inspect. The present account follows the scope stated in the manuscript rather than assuming that the intended organizational benefits were measured [1]. Published books on the methods and subject of this project provide context for this English summary [8]. Related earlier ICTU undergraduate theses provide context for this English summary [9]. Published articles on the methods and subject of this project provide context for this English summary [10].

II. Methods

The student surveyed the business process and used Visual C# and a SQL database for system design. The case study begins with the relevant workflow and identifies the information that the proposed function must receive, retain, or produce. The manuscript then describes the design or implementation choices for the selected tasks. Its diagrams, interface descriptions, or program sections provide the basis for this account. No additional test population, dataset, or deployment procedure is attributed to the work when it is absent from the thesis [1].

Supervisor: Trịnh Phú Cường.

III. Results

The report reports program-interface and database work for the selected sales tasks. These outputs show which parts of the stated task were analyzed or implemented for this case. The manuscript supports describing the selected functions and their relationship to the organization's workflow. It does not document a controlled user trial or independently measured efficiency improvement. The result is therefore a student system or analysis with a defined scope, while broader operating effects remain for a later evaluation [1].

IV. Discussion

Sales management joins customer, product, contract, invoice, and payment information. The reported output addresses part of that problem by organizing the selected data and functions. The report does not document a controlled user trial or independently measured efficiency improvement. Transaction cases and user review would be needed to establish reliable routine operation. Those checks would clarify whether the design works beyond the examples and conditions described in the graduation thesis. The project remains useful as a documented case of requirements analysis and a corresponding software or analytical response [1]. Earlier ICTU undergraduate work by Nguyễn Thị Thu Hằng addressed sales management software [7].

V. Conclusion

The student surveyed the business process and used Visual C# and a SQL database for system design, and the report reports program-interface and database work for the selected sales tasks. This establishes a case-specific output for sales management at Tan Viet Dung Construction and Trading Services. The manuscript does not document a controlled user trial or independently measured efficiency improvement. Transaction cases and user review would be needed to establish reliable routine operation. Accordingly, claims of routine adoption or measured organizational improvement remain outside the result demonstrated here [1].
