

Development of a real estate information search platform in Thai Nguyen integrating AI data analysis

Nguyen Manh Cuong

Abstract: In the context of increasing demand for real estate information, this topic focuses on developing an online platform to provide data search and analysis solutions for the real estate market in Thai Nguyen. The objective of the research is to build an automated system to collect, process, and display accurate information from diverse sources, while applying artificial intelligence (AI) to the analysis process to provide in-depth insights for users. The approach includes practical field research combined with data modeling using AI technology. This topic not only makes a significant contribution to improving the efficiency of the real estate market but also creates a solid technical foundation for future applications.

Keywords: real estate search platform, information, Thai Nguyen, artificial intelligence (AI), data analysis
