

Building a web application to manage delivery personnel ensuring information security.

Nguyen Van Dai

Abstract: In the context of technological and e-commerce development, ensuring information security for delivery personnel has become urgent. This topic focuses on building a delivery personnel management system to optimize the delivery process and enhance personal information security. Through theoretical research combined with practical implementation, the topic aims to provide a comprehensive solution for transportation enterprises. The expected results will contribute to the sustainable development of information technology in the field of e-commerce transactions.
