

Building a web-based boarding house management system

Do Huu Dang

Abstract: In the context of the increasing demand for rental housing among students and young workers, this topic focuses on building an online boarding house management system. The main objective is to provide a technical solution that helps landlords easily manage information about rooms, tenants, and related transactions. Through experimental research, the topic combines Web system design methods with modern development technologies to build an intuitive and efficient application. The expected results bring convenience and time savings for both landlords and tenants, while also contributing to the development of the real estate market in the digital era.

Keywords: Motel management system, Web technology, Online application development, Real estate market, Transaction process
