

Building an Android beverage ordering application integrated with AI for drink recommendations.

Ta Thanh Dat

Abstract: In the current era of rapid digitalization, building a mobile application to serve beverage ordering needs is extremely necessary. This topic focuses on developing an Android application with AI-based drink recommendation capabilities, aiming to enhance user experience and optimize the product selection process. Through theoretical research on AI and practical system development, this topic aims to provide a specific and feasible application solution for businesses in the food service industry. The expected results will bring significant value to both users and managers.

Keywords: Android application, Artificial Intelligence (AI), Beverage ordering, Application research, Recommendation system
