

Building a food sales website system integrated with AI to suggest personalized nutritional menus.

Le Thanh Do

Abstract: In the context of increasing demand for scientific diets and balanced nutrition, this topic focuses on building a food sales website system, integrating artificial intelligence (AI) to suggest personalized menus based on user information. The objective of the research is to identify the specific nutritional needs of each individual and automatically recommend suitable products to enhance quality of life. The method combines AI theory with application deployment experiments to ensure the accuracy and usefulness of the system. The expected results will provide a comprehensive solution for food selection, contributing to the improvement of public health.
