

Research and application of the large language model Llama 3 in analyzing the risks of labor contracts.

Nguyen Thi Thuy Dung

Abstract: This topic focuses on researching and applying the large language model Llama 3 to analyze risks related to labor contracts. In the current context, the development of information technology has created an increasing demand for data-driven and machine learning-based solutions to support risk management in the human resources field. The objective of this topic is to build an automated risk analysis system that helps businesses identify, assess, and effectively manage risks related to labor contracts through the use of the Llama 3 model. The research methodology includes both theoretical and experimental research to ensure highly applicable results. This topic is expected to make a significant contribution to the field of risk management in labor contracts and provide a foundation for the development of similar technological solutions.

Keywords: Large language model, Llama 3, risk analysis, labor contract, risk management
