

Building an AI Agent application to support students of the University of Economics and Business Administration in searching for academic information based on RAG technique.

Nguyen Thu Ha

Abstract: In the context of increasingly developing education, managing academic information has become important for students. This topic focuses on building an AI Agent application to support students of the University of Economics and Business Administration in quickly and accurately retrieving academic information based on the Retrieval-Augmented Generation (RAG) technique. The objective of the topic is to develop a system that helps reduce the workload for academic management staff while enhancing learning efficiency for students. The research method combines AI theory and experimentation to ensure the accuracy and interactivity of the system. Through this, the topic aims to contribute a useful solution for improving academic information management in universities.
