

Building a room rental search and leasing application integrated with an AI chatbot

Tran Huy Hoang

Abstract: In the context of today's strong digitalization, the need to search for and rent rooms has become urgent. This topic focuses on developing an application integrated with an AI chatbot to assist users in easily managing information about rental rooms, while optimizing the transaction process between landlords and customers. Through a combination of theoretical research and experimentation, this topic not only contributes to the field of information technology but also provides a useful solution for the modern real estate market.

Keywords: Room rental search app, AI chatbot, Real estate management, Information technology, Online transaction
