

Building a part-time job connection system for students

Truong Thi Hue

Abstract: In the context of an increasingly diverse labor force and the development of digital technology, this topic focuses on building a part-time job connection system specifically for students. The goal is to address the lack of information about part-time job opportunities within the academic community and help students easily search for and select jobs that fit their personal schedules. The research methodology includes both theoretical and empirical analysis to build the system. The expected outcome is to provide an effective solution for both students and businesses, contributing to the development of work skills and professional experience for students while also creating additional employment opportunities for educational institutions.

Keywords: connection system, part-time jobs, students, digital technology, human resource management
