

Build a website to support searching and posting rental rooms.

Luong Manh Khai

Abstract: In the context of high demand for accommodation for students and workers, this topic focuses on building a web system to effectively support the process of searching for and posting rental rooms. The main objective of the project is to create a simple, easy-to-use online platform that helps reduce the burden on users in finding suitable accommodation. By integrating technologies such as modern web programming and content management systems (CMS), the topic will apply a combination of theoretical research and experimentation to develop the system. This proposal is expected to provide a useful solution, contributing to improving the quality of life for urban residents.
