

Building a personal task management system.

Phung Quang Minh

Abstract: In the context of modern life with increasing work demands and complex time allocation, this topic focuses on building a personal task management system to help users effectively organize and arrange daily tasks. Through theoretical research and experimental implementation, the project aims to design and develop a digital platform that supports optimizing work time and enhancing personal productivity. The expected outcomes of this system not only contribute to improving users' task management but also provide practical application solutions in modern work environments.
