

Developing a system to connect candidates and employers - JobConnect.

Luan Duy Nhat

Abstract: This topic focuses on developing the JobConnect system to optimize the job search process for both candidates and employers. With the advent of digital technology, the need to address the problem of information asymmetry between stakeholders in the labor market is increasingly urgent. The objective of the research is to build an intelligent connection system, based on data analysis and machine learning, to enhance the ability to search and apply for suitable positions. The method combines data science theory with practical application deployment. Through this, the topic expects to provide an innovative solution that supports improving efficiency in the dialogue between the labor market.

Keywords: JobConnect, data analysis, machine learning, job search, candidate matching
