

Building a web management system for the Nam Thai - Thai Nguyen Knowledge Tutoring Center.

Hoang Van Thien

Abstract: In practice, the management of information and operations at knowledge training centers still faces many limitations. This project aims to build a web system to improve management efficiency and serve learners. Through the research process, we apply a method combining theory and experimentation to design a user-friendly interface and flexible management functions. The goal is to create a professional and modern management support tool for the Nam Thai - Thai Nguyen knowledge training center, thereby enhancing quality and meeting the increasingly diverse learning needs of the community.
