

BUILDING A WEB APPLICATION USING AI TO RECOGNIZE AND CLASSIFY SPORTS JERSEYS

Tran Thi Thuy Trang

Abstract: This topic focuses on building an AI-based web application for recognizing and classifying sports jerseys. In the current context, the demand for managing and classifying sportswear is increasing in retail stores and warehouses. The objective of the topic is to develop an AI system capable of automating this process through learning from image data. The research method combines experimentation and application deployment, ensuring practical applicability. The expected result is a useful solution to improve warehouse management efficiency and customer shopping experience.

Keywords: Web application, Image recognition, Sportswear classification, Artificial intelligence, Warehouse management
