

Building an AI-integrated delivery log system to support data analysis and querying for Khuong Phuc enterprise.

Nguyen Dinh Trong

Abstract: This topic focuses on building a delivery log system integrated with artificial intelligence (AI) to enhance transportation management and data analysis efficiency for Khuong Phúc Enterprise. The research background is based on the practical reality where the demand for fast and accurate delivery information management is increasing. The objective is to develop a system that supports data query and analysis through AI to optimize the delivery process. The approach combines theoretical research with experimentation to ensure the flexibility and effectiveness of the solution. The expected outcome is that the topic will provide the enterprise with an advanced management tool, helping to improve productivity and reduce operational costs.
