

Building a small-scale online 3D model sales website integrated with an AI chatbot for customer support consultation.

Ngo Quang Vu

Abstract: In the context of increasingly developing digital technology, building a small-scale online 3D model e-commerce system has become an essential need to enhance user experience and optimize the transaction process. This project aims to solve the problem of creating a professional web platform integrated with an AI chatbot to support customer consultation. The research method is carried out by combining theory with experimentation to ensure the effectiveness and feasibility of the system. It is expected that the project will make an important contribution to the application of artificial intelligence technology in the field of e-commerce.
